1.1 About

The MVR-M257 motor protection relay is a modular protection and control solution for larger and more important motors that require a large I/O capacity. You can add up to total 11 option modules (I/O and other type of modules) into the device for extensive monitoring and control applications. MVR-M257 communicates using various protocols, including the IEC 61850.

NOTE Harmonics generally: The amplitude of the harmonic content **must** be least $0.02 \times I_N$ when the relative mode (I_h/IL) is used!

Blocking: To achieve fast activation for blocking purposes with the harmonic overcurrent stage, note that the harmonic stage may be activated by a rapid load change or fault situation. An intentional activation lasts for approximately 20 ms if a harmonic component is not present. The harmonic stage stays active if the harmonic content is above the pick-up limit.

Tripping: When using the harmonic overcurrent stage for tripping, please ensure that the operation time is set to 20 ms (DT) or longer to avoid nuisance tripping caused by the above-mentioned reasons.

2.7.2 Programmable stage (PSx>/<; 99)

The programmable stage is a stage that the user can program to create more advanced applications, either as an individual stage or together with programmable logic. The device has ten programmable stages, and each can be set to follow one to three analog measurements. The programmable stages have three available pick up terms options: overX, underX and rate-of-change of the selected signal. Each stage includes a definite time delay to trip after a pick-up has been triggered.

The programmable stage cycle time is 5 ms. The pick-up delay depends on which analog signal is used as well as its refresh rate (typically under a cycle in a 50 Hz system).

MVR-25x folio

To meet marine class society requirements:

- The MVR must be configured so that the **Trip LED** (**• !**) is lit whenever a protection activates a breaker trip.
- For each trip protection, select *Trip ON* in the NOC EventMask. In this way, the cause of any trip is shown on the main screen and immediately visible to the operator.
- Alarm LED colours must be configured as follows:

| Alarm state | Details | LED colour |
|---------------|--|-----------------|
| OK | There is no alarm. | Green |
| Warning | There is an alert for the operator, but no alarm action. | Yellow (Orange) |
| Trip or Fault | The controller has sent a trip signal the breaker. | Red |
