**NOTE** Harmonics generally: The amplitude of the harmonic content **must** be least  $0.02 \times I_N$  when the relative mode ( $I_h/IL$ ) is used!

**Blocking:** To achieve fast activation for blocking purposes with the harmonic overcurrent stage, note that the harmonic stage may be activated by a rapid load change or fault situation. An intentional activation lasts for approximately 20 ms if a harmonic component is not present. The harmonic stage stays active if the harmonic content is above the pick-up limit.

**Tripping:** When using the harmonic overcurrent stage for tripping, please ensure that the operation time is set to 20 ms (DT) or longer to avoid nuisance tripping caused by the above-mentioned reasons.

**Table 4.10** Frequency measurement accuracy.

Frequency measurement performance	
Frequency measuring range	6...75 Hz fundamental, up to the 31st harmonic current or voltage
Inaccuracy	20 mHz*

**NOTE** If one of these conditions is met, the frequency inaccuracy is  $\pm 30$  mHz:

- $f \neq 50$  Hz or 60 Hz.
- Frequency tracking via voltages is applied.
- $U < 15$  V.

## 4.7 Folios and configuration

### MVR-21x folio

To meet marine class society requirements:

- The MVR must be configured so that the **Trip LED** (●) is lit whenever a protection activates a breaker trip.
- For each trip protection, select *Trip ON* in the NOC EventMask. In this way, the cause of any trip is shown on the main screen and immediately visible to the operator.
